

Network-Wide Ad Blocking & Security Sinkhole

Project Overview

This project involves the deployment of a **Pi-hole** server on a Raspberry Pi to act as a private DNS sinkhole for a home network.

By centralizing DNS resolution, this implementation provides network-wide protection against advertisements, trackers, and malicious domains, enhancing both privacy and security for all connected devices (PCs, smartphones, IoT, Smart TVs).

□ Network Architecture & DNS Flow

By centralizing DNS resolution through the Pi-hole, the network establishes a single inspection point.

This allows for efficient, network-wide filtering of trackers, ads, and malicious domains before they ever reach the end-user devices.
